

ENTRANT™

Waterproof Breathable Fabric

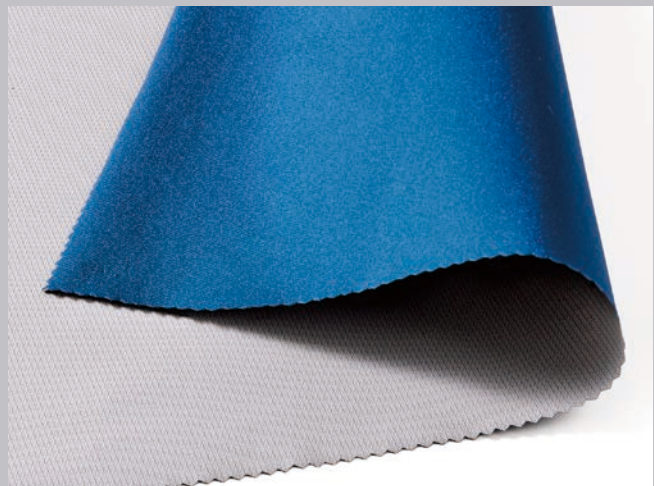

V-DT type

Achieving a good balance of functionality

ENTRANT™ is an all-rounder fabric that keeps the inside of clothes comfortable by balancing two different functionalities - waterproofness and breathability.

ENTRANT™ V in the ENTRANT™ series, has a high level of A-1 moisture permeability due to the structure of the film. Water vapor can go through this specific film (direct-ventilation), thus reduces the stuffiness inside of clothes. With this feature, ENTRANT™ V is suited for urban wear and rain wear.

Furthermore, by adding the DT (dry touch) process to the ENTRANT™ V, it becomes even more comfortable to wear.

The numerous micro-pores inside and on the surface of this film, is small enough to blocks water molecules from passing through, while allowing water vapor to escape. The bigger pores on the skin side, brings out the soft touch.

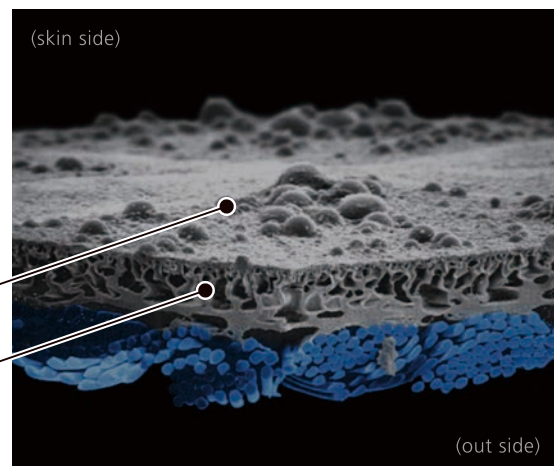

Waterproofness : 10,000 mm
A-1 air permeability : 10,000 g
B-1 air permeability : 10,000 g

< Film face >

The DT process gives the fabric a dry touch feeling.

< Sectional-View >

A large porous layer and a small porous layer is controllably made. These Numerous pores help exert a high level of breathability.
